

# NexaTech

## Windsor Connector Strategy & GitHub Project Overview

**Purpose.** Define the connector foundation for NexaTech and prioritize integrations that can cover the widest range of Windsor-Essex businesses.

### Important research note

There is no reliable public dataset showing the exact percentage of Windsor businesses using each software product. Accordingly, the priority list below is a market-coverage strategy, not a claimed local market-share ranking. It combines Canadian adoption signals, cross-sector usefulness, Windsor's business mix, API/integration feasibility, and the value of the data each system can unlock.

## 1. GitHub README - concise project overview

### NexaTech - One intelligent layer for your business.

NexaTech is an AI-powered business operations platform designed to connect the software a business already uses, unify its data, and automate repetitive workflows. Instead of replacing existing systems, NexaTech acts as an intelligent layer across them.

### Architecture

Business Software -> NexaConnect -> Universal Data Layer -> NexaTech Core -> AI / Automation / Analytics

**NexaConnect** is the universal integration layer. It is designed to support OAuth 2.0, REST APIs, webhooks, SQL, CSV/Excel, files/documents and, later, a secure local agent for legacy systems.

**MVP:** build the connector SDK, universal business data model, authentication framework, mapping/normalization engine, Microsoft 365 and Zoho proof of concept. cross-system queries. workflows. permissions and audit logging.

**Design philosophy:** Connect -> Normalize -> Understand -> Automate -> Act.

**Status:** Early development / proof of concept. Initial market validation is Windsor-Essex, Ontario, while the architecture remains industry- and location-independent.

## 2. What NexaTech should call a connector

A NexaTech connector is not simply an API call. Every integration should implement the same internal contract so NexaTech Core does not care which vendor stores the source data.

**Standard lifecycle:** Install -> Authenticate -> Discover capabilities -> Map fields -> Initial sync -> Incremental sync/webhooks -> Health monitoring -> Revoke.

### Core connector capabilities

| Capability family | Examples                                                    |
|-------------------|-------------------------------------------------------------|
| Communication     | email.read, email.send, messages.read                       |
| Calendar          | calendar.read, calendar.write                               |
| CRM               | customers.read, contacts.read, leads.read, deals.read/write |
| Finance           | invoice.read/write, expenses.read, payments.read            |
| Commerce          | orders.read, products.read, inventory.read/write            |
| Workforce         | employees.read, time.read, payroll.read                     |
| Operations        | workorders.read, assets.read, maintenance.read              |
| Documents         | files.read/write, documents.search                          |

## 3. Windsor connector priorities

The strongest first connectors are horizontal systems used across many industries. Industry-specific integrations should come after the foundation unless a paying pilot creates a clear reason to move one forward.

| Tier | Connector / family                    | Primary coverage                          | Why NexaTech wants it                                                                                     |
|------|---------------------------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| P0   | Microsoft 365 / Graph                 | Almost every sector                       | Outlook mail/calendar, contacts, OneDrive, SharePoint, users and collaboration data through one ecosystem |
| P0   | CSV / Excel / XLSX                    | Universal                                 | Fallback for businesses with exports, spreadsheets or systems without usable APIs.                        |
| P0   | Generic REST + OAuth 2.0              | Universal                                 | Makes future SaaS connectors much faster to implement.                                                    |
| P0   | SQL (SQL Server / MySQL / PostgreSQL) | Industrial + custom systems               | Covers databases, on-prem apps, reporting systems and many legacy environments.                           |
| P0   | Google Workspace                      | SMB + professional services               | Gmail, Calendar, Drive, contacts and documents.                                                           |
| P1   | QuickBooks Online                     | SMB accounting                            | Customers, vendors, invoices, expenses, payments, products and financial workflows.                       |
| P1   | Sage                                  | Accounting + construction + SMB           | Strong Canadian accounting presence and useful finance/business data.                                     |
| P1   | Xero                                  | SMB accounting                            | Cloud accounting alternative with broad integration use.                                                  |
| P1   | Payworks                              | Payroll / HR                              | Canadian payroll, HR and time data; Payworks says it serves about 40,000 Canadian clients.                |
| P1   | ADP                                   | Payroll / HR                              | Payroll and workforce management across business sizes.                                                   |
| P1   | Dayforce                              | HR / enterprise                           | HR, payroll, workforce and enterprise employee data.                                                      |
| P1   | Square                                | Retail + food + services                  | Orders, payments, customers, catalogue and inventory.                                                     |
| P1   | Shopify / Shopify POS                 | Retail + e-commerce                       | Online/in-store orders, customers, products and inventory.                                                |
| P1   | Clover                                | Retail + restaurants + services           | POS, payments, inventory and staff operations.                                                            |
| P1   | Lightspeed                            | Retail + hospitality                      | Inventory-heavy retail and restaurant operations.                                                         |
| P1   | Moneris                               | Canadian payments / POS                   | Important Canadian payment/POS ecosystem.                                                                 |
| P1   | TouchBistro                           | Restaurants                               | Restaurant-specific POS and operational data.                                                             |
| P2   | Zoho CRM / Zoho Books                 | SMB CRM + finance                         | Leads, contacts, deals and related business workflows.                                                    |
| P2   | HubSpot                               | Sales + marketing                         | CRM, contacts, companies, deals, tickets and marketing activity.                                          |
| P2   | Salesforce                            | Mid-market + enterprise                   | Major CRM; high-value but more complex customer environments.                                             |
| P2   | Microsoft Dynamics 365                | Manufacturing + distribution + enterprise | CRM/ERP ecosystem with strong Microsoft fit.                                                              |

| Tier | Connector / family           | Primary coverage            | Why NexaTech wants it                                                 |
|------|------------------------------|-----------------------------|-----------------------------------------------------------------------|
| P2   | SAP                          | Manufacturing + enterprise  | ERP, purchasing, production, inventory and finance.                   |
| P2   | Oracle NetSuite              | Mid-market ERP              | ERP, finance, orders, inventory and operations.                       |
| P2   | Jobber                       | Home/field services         | Jobs, customers, quotes, scheduling, invoicing and field operations.  |
| P2   | ServiceTitan                 | Trades / field services     | Dispatch, jobs, customers and service workflows.                      |
| P2   | Procore                      | Construction                | Projects, documents, contractors and construction workflows.          |
| P2   | Monday.com                   | Cross-sector project work   | Tasks, projects and operational workflows.                            |
| P2   | Slack                        | Cross-sector communication  | Messages and workflow triggers where Slack is used.                   |
| P2   | Twilio / business telephony  | Cross-sector communications | Calls, SMS, notifications and AI phone workflows.                     |
| P3   | MES / CMMS / OPC-UA adapters | Manufacturing               | Machine, downtime, maintenance, production and asset data.            |
| P3   | EMR / FHIR-enabled systems   | Healthcare                  | Administrative/clinical integration where authorized and compliant.   |
| P3   | Local Agent / RPA fallback   | Legacy businesses           | Last-mile compatibility for software with no modern integration path. |

## 4. Recommended build order

### Phase A - Universal foundation

1. Connector SDK
2. OAuth 2.0 + secrets vault
3. REST client
4. Webhook receiver
5. CSV/XLSX ingestion
6. SQL adapter
7. Connector registry + health monitoring
8. Mapping/normalization engine

### Phase B - Highest-coverage native connectors

Microsoft 365 -> QuickBooks Online -> Google Workspace -> Zoho -> Payworks assessment/integration path -> Square -> Shopify -> Sage -> Clover/Lightspeed.

### Phase C - Sector expansion

Dynamics 365 / SAP / manufacturing adapters -> Jobber / ServiceTitan / Procore -> restaurant systems -> HR/payroll expansion -> healthcare integrations -> other vertical systems.

## 5. The first proof of concept

Start with Microsoft 365 + Zoho CRM. Microsoft Graph exposes Outlook mail/calendar and Microsoft 365 file services; Zoho CRM supports OAuth 2.0 and CRM resources such as leads, contacts and deals. Normalize both systems into NexaTech and prove a cross-system query such as:

"Show customers with active Zoho opportunities who emailed us this week, then create follow-up tasks for the ones without a response."

This proves the important part of NexaTech: it is not simply another dashboard. It creates one operational layer across systems that were previously disconnected.

## 6. Payworks strategy

Payworks deserves a high-priority position because payroll and workforce data applies across sectors. Public material confirms Payworks offers integrations including QuickBooks Online, while Canadian payroll comparisons report roughly 40,000 Payworks clients nationally. However, NexaTech should verify the exact developer/partner access available for the desired Payworks data before promising a broad native API connector.

**Fallback hierarchy:** Native/partner API -> supported accounting integration -> scheduled export/report -> secure file ingestion -> approved local agent. Do not use brittle UI automation unless there is no supported integration path.

## 7. How to determine the real Windsor ranking

NexaTech should build its own Windsor technology dataset from every sales conversation. Ask each prospect which systems they use for email, accounting, payroll, POS, CRM, inventory, scheduling, HR, ERP and industry-specific work. Record the answers in the Connector Registry. After 50-100 businesses, NexaTech will have more useful local integration intelligence than a generic national software list.

**Suggested score:** Windsor observed usage 30% + cross-sector reach 20% + customer demand 20% + workflow/data value 15% + integration feasibility 10% + strategic value 5%.

## 8. Research basis

Canadian sources reviewed for this strategy include Microsoft Graph documentation, Zoho CRM developer documentation, Payworks integration material, Sage Canada, ADP Canada payroll comparisons, Shopify Canada POS research, Clover Canada, and Canadian POS market comparisons. These sources support the platform families and integration capabilities used in this roadmap; they do not establish exact Windsor market share.

Clover Canada: <https://www.clover.com/ca>

**NexaTech direction:** build the connector framework once, then expand compatibility according to measured Windsor demand. The objective is not to build 30 unrelated integrations; it is to create one connector architecture capable of absorbing the next 30.
